Document Extract

This page exists to give an optical character recognition pipeline realistic dense body text to work against, similar to a scanned page from a printed report or book.

Variation in line length, word spacing and paragraph breaks is intentional, since real scanned pages rarely wrap perfectly and OCR software needs to handle that variation correctly.

ToollyX generates this content locally in the browser, then rasterizes and degrades it so the resulting file behaves like an actual scan rather than a clean vector document.
